

IOS Idea

Pensieve is a memory collection app. Users can store pictures, locations, dates and times as memory points as they map an outing. The app allows the user to start a “memories collection” which they name. At any point in that memory collection, the User can stop and take a photo which will be stored along with any notes the user wishes to associate with it, the time and the specific and relative locations. The user can end a memory collection at any time. At later dates, the user can go back and access prior memory collections, or edit old collections. When viewing a memory collection, the user will see a map of each memory point location. The memory point locations can be selected to get the picture, details and time of the memory point occurrence.
